Step 2: App Service Logs	34
Step 3: Health Check	36

Task 2.1

In Task 2.1, we deployed a basic ASP.NET Core web application to Microsoft Azure using Visual Studio. This involved setting up an Azure account, creating a publish profile, and publishing the application to Azure App Service. The objective was to verify that the application was successfully deployed and publicly accessible through a live URL.

Step 1: Create a new project, name and additional information

Figure 1: Create a new Project

Configure your new project

ASP.NET Core Web App (Model-View-Controller)C#LinuxmacOSWindowsCloudServiceWeb

Project nameWebApplication1

LocationD:\Swinburne\Year 3\Sem 2\Evolution\P2\...

Solution name ⓘWebApplication1

☐ Place solution and project in the same directory

Project will be created in "D:\Swinburne\Year 3\Sem 2\Evolution\P2\WebApplication1\WebApplication1\"

Step 2: running the application, and set up an account

Figure 4: dashboard, run the application without debugging

Figure 5: accepting SSL Certificate

```
Show output from: Build
Build started at 08:47...
1>----- Build started: Project: WebApplication1, Configuration: Debug Any CPU -----
1> Skipping analyzers to speed up the build. You can execute 'Build' or 'Rebuild' command to run analyzers.
1> WebApplication1 -> D:\Swinburne\Year 3\Sem 2\Evolution\P2\WebApplication1\WebApplication1\bin\Debug\net10.0\WebApplication1.dll
===== Build: 1 succeeded, 0 failed, 0 up-to-date, 0 skipped =====
===== Build completed at 08:48 and took 12,487 seconds =====
```

Figure 6

Figure 7: install certificate

Figure 8: Click yes to trust the IIS Express SSL certificate

Figure 9

Figure 10: how it looks like when running using localhost

Step 3: making an azure account

Click on the project and then select publish, select azure and then azure app service (windows)

Figure 11: select Azure

Figure 12: Select Azure App Service (windows)

Figure 13: Create a new instance

In this step after selecting create a new instance it will ask to add account or make a new account, at first I used Swinburne account and it was not eligible for the free subscription so I switched to personal account

Figure 16: make sure the subscription name is “Azure subscription 1” and selected “Canada Central as Hosting Plan”

Figure 17: Hosting Plan was not eligible (Canada Central)

Figure 20: Publish Finished

Figure 21: page where it brings when it finishes the publish and, on the page, can be found "Site: ..." the site that brings to see the application deployed in Azure

Figure 22: The page after clicking on the URL

Figure 23: Azure portal

Task 2.2

For 2.2 we will be making a simple app using C# and publish it to azure

Step 1: Create new project

Figure 1: create a new project

Figure 2: select a name

Figure 3: Create

Figure 4: make a new file or project

Figure 5: on the right side find models and then right click and select add>class

Step 2: Codes

Figure 6: create the class (rename it to the name wanted)

Figure 7: code for Student.cs

Figure 8: following the previous step create a StudentController.cs but select Controllers instead of Models

Figure 9: Code for StudentController.cs

Figure 10: On the right side, right click on views and add new folder name it Student

Figure 11: right click on the Student folder just created and then add>view and add

Figure 12: name it *Index.cshtml* and then add

Figure 13: put into *Index.cshtml*

Figure 14: right click on student folder again, and select view

Figure 15: create and add (name it Create.cshtml)

```
Create.cshtml*  Index.cshtml*  StudentController.cs  Student.cs*  WebApplicati...2.2: Overview
WebApplication(2.2)  ASP.NET Core Generated Document.Views_Studen  ExecuteAsync()

1  @model WebApplication2_2.Models.Student
2
3  <div class="container mt-5">
4      <h2>Add New Student</h2>
5
6      <form method="post" action="/Student/Create">
7          <div class="form-group mb-3">
8              <label for="Name">Student Name:</label>
9              <input type="text" class="form-control" id="Name" name="Name" required>
10         </div>
11
12         <div class="form-group mb-3">
13             <label for="Email">Email:</label>
14             <input type="email" class="form-control" id="Email" name="Email" required>
15         </div>
16
17         <button type="submit" class="btn btn-success">Add Student</button>
18         <a href="/Student/Index" class="btn btn-secondary">Cancel</a>
19     </form>
20 </div>
```

Figure 16: put into Create.cshtml

Figure 17: Run it and see from the web

Figure 18: Web application on the web (if doesn't show this use - [WebApplication_2_2](#))

A screenshot of the 'Add New Student' form. The page has a header with 'WebApplication_2_2', 'Home', and 'Privacy' links. The main content area features the title 'Add New Student'. Below the title, there are two input fields: 'Student Name:' and 'Email:'. At the bottom of the form, there are two buttons: 'Add Student' (green) and 'Cancel' (grey). At the bottom of the page, there is a footer with '© 2026 - WebApplication_2_2 - [Privacy](#)'.

Figure 19: Add new Student

Add New Student

Student Name:

Daniel Johansson Tan

Email:

105075074@student.swin.edu.au

Add Student

Cancel

Figure 20: Fill in information, and then click on Add Student

Student Registration

Add New Student

2	Daniel Johansson Tan	105075074@student.swin.edu.au	Delete

Figure 21: Student Created

Student Registration

Add New Student

No students registered yet.

Figure 22: click on delete-to-delete Students information

Step 3: Publish

Figure 23: After making sure everything is correct and running publish to Azure (right click on the project and select publish)

Figure 24: Select Azure

Figure 25: select Azure App Service (Windows)

Figure 26: Make sure you select the correct account, and then click on create a new instance and name it StudentRegistrationApp (or any name) and then select the Hosting Plan and create

Figure 27: Click Finish

Figure 28: wait until it finishes to deploy

Figure 29: find the URL on the page and click on it to be directed to the web

URL: <https://studentregistrationapp-e8dqafdje3b4cddu.australiasoutheast-01.azurewebsites.net>

Task 2.3

For Task 2.3 we will be implementing an active health check or Azure App Service Logging

Step 1: Configure App Settings

Figure 1: go into your StudentRegistrationApp and on the left side click on Settings

Figure 2: find Environmental Variables

Figure 3: Click on add and then fill the Name and Value and Apply

Figure 4: add another one and fill the Name and Value and then Apply

Figure 5: you should see it added after adding them in and then click on Apply on the bottom left

Step 2: App Service Logs

Figure 6: on the left side find Monitor and click on App Service Logs

Step 3: Health Check

Figure 9: go to the left side and find monitoring and click on Health Check and then for the path put (/api/health) and save

Figure 10: go back to overview and check the Health Check (healthy/unhealthy)

Self-Troubleshooting

1. Swinburne account isn't eligible for the free account
2. Hosting Plan (Canada Central doesn't work so switch to Australia Southeast)
3. Application logging keep resetting to "off" after getting turn "on"
